# Wheaton PET Diagnostic Bottles

- Crystal clear lightweight plastic containers
- Break resistant alternative to glass
- Good resistance to some solvents, weak acids and oils
- Packed ready for sterilization

The new Crystal Clear Wheaton PET Diagnostic Bottles (Polyethylene Terephthalate) are a lightweight, break resistant alternative to glass for packaging liquid diagnostic, biological, veterinary, and ophthalmic products. They are available in 5, 10, and 20 mL sizes, ideal for storage and shipment of reagents and buffer solutions. They are also available in amber for light sensitive materials. When compared to PETG containers (Polyethylene Terephthalate Glycol), PET bottles exhibit higher oxygen and carbon dioxide barrier properties as well as better chemical resistance. These bottles are packed shrink-wrapped ready for sterilization.

The polypropylene caps are available in six colors: blue, red, yellow, green, white and black. They have a 20-410 screw thread finish and a F217 foam liner. Caps are packaged double bagged and twist-tied to reduce particulate.
